How to Measure

Simulated
Divided Lite

How to Measure for Simulated Divided Lite (SDL) Grilles

Measurements must be taken on the inside and the outside of the glass.

- To measure **Daylight Opening (DLO)**, measure the visible glass, from stop to stop.
- To measure the **Tip-to-Tip** dimension, measure the longest part of the grille on the top of the profile (the portion that faces outward from the glass).
- To measure the **Underneath** dimension, measure the shortest part of the grille bar, on the bottom of the profile (the portion that touches the glass).
